

READING / RESEARCH NOTE

Ed — THE UNIVERSE SLATE, mechanism axis (run-ed-slate1), 2026-08-23

The CEO's selection sheet (step 3 of the immediate goal — expansion beyond META). Filed by the chair; full Tables A/B verbatim in run run-ed-slate1. Independent of Doc's data-richness slate (pending); overlap is signal. Zero proposals filed — selection is the CEO's row.

The selection rule

One rule before all else: **name the party who must trade the security, the document or statute that obliges them, and the date.** Then: is the obligation live TODAY (verified this hour); does the name move enough per tick that a mismatch is harvestable at \$2k; does our feed serve it.

THE SIXTEEN (ranked ten in bold if a tighter list is wanted)

#	TICKER	MECHANISM CLASS	THE OBLIGED PAYER (VERIFIED)	M/T*
1	FWONK+FWONA	Share-class / index eligibility	Index funds must hold the non-voting K, cannot hold voting A → persistent A-discount. MEASURED AND CONTROL-DISCRIMINATED THIS RUN: 3y spread mean −9.14%, sd 1.23pp, reversion corr −0.607 (36 non-overlapping blocks) vs control GOOGL/GOOG (both index-eligible): sd 0.58pp, corr −0.167 — 2× amplitude, 3.6× reversion. Harvestable form is LONG-ONLY A↔K rotation (~half amplitude; no shorting here).	129
2	DTE	Mandated equity issuer	DTE itself: \$500–600M/yr equity 2026–28, \$1.5bn ATM (Dec-25), forwards already printed — a price-insensitive seller ~3 days ADV/yr	114
3	MSTR	Contractual cash obligation	Payer re-identified mid-run: the ATM-premium seller is DEAD (mNAV 0.68× vs 3.4× peak); the LIVE payer is the preferred coupon stack (STRK 8%/STRF 10%→18% cumulative/STRD 10%/STRC 12% SEMI-MONTHLY cash) — drove the first BTC sale since 2022. Plus \$8.25bn converts' dealer delta-hedging	450
4	OBDC	Statutory NAV-keyed issuer	'40 Act §63/§23(b): a BDC may not sell common below NAV — a regime switch on a published number. CAUTION: tick 8.85bps caps turnover at ~quarterly	13
5	USO	Commodity roll, date-pinned	Holders pay a published roll; methodology PINNED by its own filings at 2020-04-17/2020-05-01 — any claim splits there. Prior: dead post-2020; one pass decides	300
6	PLTR	Disclosed-plan insider seller	10b5-1 plans (entered 2025-12-11, sales printed May–Aug 26) — price-insensitive by construction; Form 4 dates public in 2 days	457
7	ET	Mandate-exclusion clientele	RIC 25% QPTP cap + UBTI + index exclusion = statutory shortage of natural buyers — and the constraint does not bind US. Premia-shaped, K-1 cost noted	17
8	TSLA	Derivative-income ETF roll	YieldMax complex (\$9.29bn, 60 funds, weekly distributions) sells upside on schedule. Sample only ~3y; if flow <1% ADV the row dies	811
9	CYTK	Event-dense product cycle	Densest product-event name in our panel (26.2 8-K/yr). Weakest payer story on the slate — said before anyone asks	171
10	SPY	Benchmark + hedge ONLY	Excluded as research object — the unconditional position keeps beating rules built on it	477
11–16	NVDA, CP, ANGL, DBC (control), TLT, DBA	See run record	Cut order if tightening: DBA, TLT, DBC, CP, ANGL, NVDA	

*m/t = mean daily move ÷ one-tick cost — the mismatch headroom at our size.

Three checks that changed the slate mid-run (the memo's real value)

- 1. **EIX DROPPED**: its own 2026–30 plan states NO equity issuance — the mechanism I wanted is verifiably absent.
- 2. **MSTR's payer changed identity inside 18 months** — a dossier built on the cited-everywhere ATM story would measure a ghost.
- 3. **The Liberty pair passed the constant-observable control** run before any prose (card item 12, applied to universe selection itself).

The six families, declared UNTESTED before any dossier exists

mandated_issuance (DTE, OBDC) · share_class_spread (FWONK/A) · derivative_hedging_flow (NVDA, TSLA, MSTR — dies as a family if only visible intraday) · commodity_roll (USO, DBC) · mandate_exclusion (ET, ANGL) · disclosed_insider_flow (PLTR). The graph's nine recorded families are ALL price/calendar patterns — this slate points where family-wise risk is genuinely zero.

Incumbent verdicts (to Stan)

DBA: rotate first (no nameable payer, Sharpe +0.11/11y, tick = 15% of a day's move). **TLT: a rates position, never an edge source** (excess Sharpe −0.13 since 2016; calendar measured flat across three batches). **SPY: keep** as benchmark/hedge. **DBC: keep as control**.

Instrument defects found

I1: the 8-K panel has ZERO large-caps (hunting-ground ADV ceiling \$250M — Grace's inherited-parameter flag made concrete); targeted CIK extension on selection. I2: the panel keys on ticker → multi-class undercount (FWONK 25.2/yr, FWONA 0). I3: the mechanism seat's toolset had no Agent tool — self-fanout structurally impossible from the typed seat (fixed at resolve: Agent added to frontmatter).

Primary record: run run-ed-slate1; **STATE in** .claude/state/mechanism.md. **Honorable mentions with measured exclusion reasons (EIX, WEC/OGS, LBRD pair, CEFs-blocked-on-data, UNG's 10bp tick, IBIT, GOOGL/GOOG-as-control, EPD, levered ETFs pre-killed, Russell-boundary names) in the record.**
