

READING / RESEARCH NOTE

Dr. Mike Darwin — THE LEADS SHELF v2 (run-analyst-shelf2), 2026-08-23

Filed by the chair at resolve; operative summary — the full report is verbatim in run run-analyst-shelf2. Datasets RESCUED into the repo at data/research/ (they were session-scratchpad artifacts): the CPI/NFP calendar + sourcing, the SEC dissemination lookup (118,294 rows), the E21 pre-registration. Zero containers, zero bulk extraction, host intact.

1. E21 IS CLOSED — on its own pre-registered path, plus a defect in the bar itself

The 2020 20-year reintroduction is a genuine natural experiment (76 monthly auctions at a tdom slot empty since 2009) and it is NULL: PRE coefficient -1.65 bp/day ($t=-0.25$) with day-of-month FE; DiD vs 2014–20 control -4.99 bp/day ($t=-0.74$), rank 6/18 in its own placebo ladder; null across five control eras; the 30-year leg goes the WRONG way. Pipeline validated first by reproducing Ed's own headline to three decimals. **The bigger finding: the revival bar was UNREACHABLE** — the design's SE

is 6.63 bp/day, so $|t|>2.5$ needs 16.6 bp/day against a claimed effect of 8.83 (implied $t=-1.33$); the same machinery returns only $t=-1.57$ in the

era nobody disputes. **$|t|>2.5$ with tdom FE has never been achieved by this family in any era.** CHALLENGE filed (TIGHTENS, on the CEO's desk): every pre-registered revival/kill condition must state the MINIMUM DETECTABLE EFFECT its own design delivers, beside the t-bar — a bar nobody has powered is a trigger that can only return one answer.

2. THE CPI/NFP RELEASE CALENDAR — delivered, 1994-01 → 2026-11

data/research/macro_release_dates_cpi_nfp.csv (788 rows) + SOURCING doc. Every past-dated row double-sourced (BLS schedule pages 1997–2026; BLS archived-release indexes to 1994-02; all 68 pre-1997 releases opened and their embargo lines read — 68/68 agree). **Four caveats that will bite:** the BLS archive filename is a slug, not a release date (4 confirmed disagreements; one 1:30 PM release in 788); **reference period 2025-10 does not exist for either series** (a 12-per-year loop fabricates an event); duplicate reference-period labels exist in BLS's own index; EMPSIT is Friday 379/394 while CPI spreads across four weekdays — pooling without a day-of-week control mixes two calendar objects.

3. THE COMMENT-LETTER PILE — the headline is a LOOK-AHEAD DEFECT

An SEC UPLOAD's EDGAR filingDate is the letter's authoring date, back-dated — NOT the publication date. Proven three ways (document headers 143/181; acceptanceDateTime==filingDate 600/606; EDGAR's daily dissemination index — the truth). Measured over 49,626 UPLOAD records 2020–26: **lag median 57 days, mean 103, p90 221, max 6,152; only 0.13% within one day.** Cause: SEC policy releases correspondence "no earlier than 20 business days following the completion of a filing review." **Every one of the fund's 3,185 stored UPLOAD dates is the wrong date for a price study.** Recovery instrument: the daily index, ~ 1.6 s/day, checkpointed; the 2020–26 lookup is filed at data/research/sec_correspondence_dissemination_2020_2026.csv.

The corrected pilot is a measured null on our universe ($n=331$, $N_{20} -0.774\%$ $t=-0.80$ vs the matched-date EW panel; severity splits directionally right, none significant; the +60 placebo at $N=20$ is NOT clean — carried). **Not tradeable as a basket at our size** (~ 100 events/yr ≈ 8 concurrent positions $\approx \$235$ each; the full population needs ~ 700 names + a short leg). **The defensible form: a RISK FLAG on names already held** — bundle size ≥ 2 and bundle span $> 180d$ are computable on the dissemination day (the conversation-dump structure: whole threads drop at once) and the worst pilot cell ran $-3.56\%/20d$ ($n=23$, $t=-1.61$, directional not established). Four event-study designs scoped with identification requirements and no-null controls (D1 conversation-dump severity; D2 topic-conditioned; D3 CORRESP-first asymmetry; D4 the look-ahead itself as a calibration instrument — the cheapest, both date sets exist).

What the pile contains (181 read): 36% closing letters with zero comments; median 1 numbered comment; topics led by segment reporting / revenue recognition / exec comp; going-concern 0, restatement 1. Method lesson: a topic flag that hits 100% is a bug, never a finding (VIE matched "review").

Primary record: run run-analyst-shelf2; STATE + EVOLVE in .claude/state/analyst.md and the seat file. Ed consumes this shelf in batch #3 and reports consumed/rejected per lead.
